

ABSTRACT OF THE DISCLOSURE

It is an object of the present invention to provide an audio mixer which can specify and inform whether or not each of the audio signals exceeds a threshold level, without switching to each group. The audio mixer includes: group selecting means **3** for selecting
5 one group from among groups having audio signals allocated thereto; level information display means **4** for displaying level information indicative of signal levels of the audio signals of the one group selected by the group selecting means **3**; signal level judging means **6** for judging whether or not each of the audio signals of the groups is a larger than a threshold level; and peak information display means **7** for displaying peak information of
10 each audio signal, the peak information being indicative of the judgment made by the signal level judging means **6**.
